```cpp
#include <iostream>
using namespace std;

class shape
{
public:
        double val1,val2;
        void getData()
                {
                cout<<"Enter the first value:\t";
                cin>>val1;
                cout<<"Enter the second value:\t";
                cin>>val2;
                }
        virtual void computeArea()
                {
                cout<<"Area is"<<endl;
                }
};
        class triangle: public shape
                {
                public:
                        void computeArea() override
                                {
                                cout<<"Area of Triange is:\t"<<0.5*val1*val2<<endl;
                                }
                };

        class rectangle: public shape
                {
                public:
                        void computeArea() override
                                {
                                cout<<"Area of Rectange is:\t"<<val1*val2<<endl;
                                }
                };

int main()
{
 triangle t;
 rectangle r;

 cout<<"Triangle:\n";
 t.getData();
 t.computeArea();

 cout<<"Rectangle:\n";
 r.getData();
 r.computeArea();

 return 0;
}
```
